

# **ON-FARM NUTRIENT CYCLE.**

**REDUCE, REUSE, RECYCLE  
AT ITS FINEST.**

Nebraska has lots of farmers that produce lots of crops. Those crops are harvested and fed to lots of livestock. The results is lots of meat, milk and eggs, but in between there's a lot of "output." You might call it waste, but to a farmer this output is a precious resource used to fertilize the soil for next year's crops. All of this output is carefully handled and stored safely to keep it out of places it shouldn't be. Farmers are required to have a nutrient management plan that outlines the handling, storage and application of manure.
